### Definitions and Conditions

Specifications describe the performance of parameters covered by the product warranty and apply to temperature ranges 0 to 55 °C, unless otherwise noted.

95th percentile values indicate the breadth of the population (approx. 2s) of performance tolerances expected to be met in 95 percent of the cases with a 95 percent confidence, for any ambient temperature in the range of 20 to 30 °C. In addition to the statistical observations of a sample of instruments, these values include the effects of the uncertainties of external calibration references. These values are not warranted. These values are updated occasionally if a significant change in the statistically observed behavior of production instruments is observed.

Typical describes additional product performance information that is not covered by the product warranty. It is performance beyond specifications that 80 percent of the units exhibit with a 95 percent confidence level over the temperature range 20 to 30 °C. Typical performance does not include measurement uncertainty.

Nominal values indicate expected performance, or describe product performance that is useful in the application of the product, but is not covered by the product warranty.

The analyzer will meet its specifications when:

- The analyzer is within its calibration cycle.
- Under auto couple control, except that Auto Sweep Time Rules = Accy.
- For signal frequencies < 10 MHz, DC coupling applied.
- The analyzer has been stored at an ambient temperature within the allowed operating range for at least two hours before being turned on, if it had previously been stored at a temperature range inside the allowed storage range but outside the allowed operating range.
- The analyzer has been turned on at least 30 minutes with Auto Align set to Normal, or if Auto Align is set to Off or Partial, alignments must have been run recently enough to prevent an Alert message. If the Alert condition is changed from "Time and Temperature" to one of the disabled duration choices, the analyzer may fail to meet specifications without informing the user. If Auto Align is set to Light, performance is not warranted, and nominal performance will degrade to become a factor of 1.4 wider for any specification subject to alignment, such as amplitude tolerances.

The term "mixer level" is used as a condition for many specifications in this document. This term is a conceptual quantity that is defined as follows: Mixer Level (dBm) = RF Input Power Level (dBm) - (Electronic + Mechanical) Attenuation (dBm).

### Accelerate signal insight with outstanding all-around signal analysis

The PXA is the benchmark for performance that accelerates innovation in demanding applications. With measurement options that range from excellent to exceptional, the PXA puts you in the lead.

Analyze the latest signals with up to 510 MHz analysis bandwidth and better than 78 dBc SFDR, and reveal previously hidden signals with Noise Floor Extension (NFE). To see your device's true behavior, get industry-leading phase noise performance by adding the Keysight-proprietary DDS-based LO.

Simplify migration from legacy Agilent/HP spectrum analyzers with backward code compatibility and compact 4U form-factor

### Real-time spectrum analyzer (RTSA)<sup>1</sup>

#### Option RT1 or RT2

#### Real-time analysis

Real-time analysis bandwidth		
– Option RT1	Up to 509.47 MHz	Analysis BW option determines the max real-time bandwidth
– Option RT2	Up to 509.47 MHz	Analysis BW option determines the max real-time bandwidth
– Option DUA	Up to 2 x 255 MHz at same center frequency	Requires Option B5X
Minimum detectable signal duration w	ith > 60 dB	
– Option B85	11.42 ns	
– Option B1X	5.0 ns	
<ul> <li>Option B2X or B5X</li> </ul>	3.33 ns	
Minimum signal duration with 100% pr	obability of intercept (POI) at full amplitude accuracy	For Frequency Mask Triggering (FMT)
– Option RT1	17.3 µs	Signal is at mask level
– Option RT2	3.57 μs	Signal is at mask level
Minimum acquisition time	104 µs	
FFT rate	292,969/s	

#### **Option RTS**

Real-time I/Q data streaming <sup>3</sup>		
Output stream resolution	16-bit I + jQ	
IQ streaming bandwidth	Up to 255 MHz	
Electrical interface	LVDS	
Sample rate	Varies continuously based on RTSA span setting	
Max IQ streaming bandwidth and sample rate		
– B1X	160 MHz	200 Msamples/s
– B2X or B5X	255 MHz	300 Msamples/s
Supported data recorder	X-COM Systems IQC5255B	
– Capture time	< 3 hours at 255 MHz bandwidth	
– Data tagging	Event markers, IRIG-B GPS	

1. For additional RTSA specifications, please refer to Option RT1/RT2 Chapter in the PXA Signal Analyzer specifications guide.

StM = "Signal-to-Mask".
 Use with X-COM Systems IQC5255B data recorder to capture rare events and play back at RF using integrated control software on the PXA.
