Intelligent Bipolar Power Supply PBZ20-20A

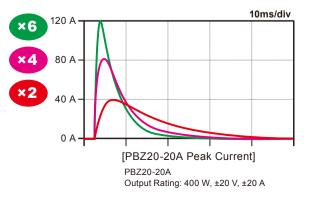

USB, GPIB and RS232C standard digital interface (LAN option available)

The PBZ20-20A Intelligent Bipolar Power Supply takes a fresh new look at bipolar power supply design, allowing for peak current up to 6 times that of the rated output. As a result, peak currents exceeding the 20 A rating can be easily compensated with a single unit, eliminating the need to connect multiple units in parallel, and greatly cutting costs.

The primary source of energy for modern-day vehicular components is the car battery, but factors such as electronic circuit chattering as well as inrush caused by the engine can be cause for concern. Disturbances in the power source caused by these factors make programming and evaluating power supply fluctuation waveforms an absolute must.

The PBZ20-20A Intelligent Bipolar Power Supply has the high speed response to meet the demands of voltage fluctuation tests (Pulse2b, Pulse4, etc.) for international standards such as the ISO16750-2 and ISO7637-2 as well as for the increasingly complicated fluctuation waveform tests required by automotive

manufacturers. The PBZ20-20A is also equipped to easily comply with the steady increase of electronic components per vehicle (high power capacitors, etc.) and total current (esp. peak current) required in modern-day automotive testing.

Intelligent Bipolar Power Supply PBZ series PBZ40-10 (±40 V/±10 A) PBZ60-6.7 (±60 V/±6.7 A) PBZ40-10 (±40 V/±10 A) PBZ80-5 (±80 V/±5 A)

USB, GPIB and RS232C standard digital interface (LAN option available)

The PBZ is a series of bipolar DC programmable power supplies that can smoothly pass through zero to provide \pm voltage and \pm current without changing the output terminals. The PBZ is capable of 4-quadrant operation, meaning that it is capable of both sourcing and sinking power, ideal for driving both inductive and capacitive loads.

This power supply comes equipped with a built-in function generator, allowing for easy waveform and sequence generation. The output current of the PBZ can be expanded among multiple units by using the synchronization feature. The switching + linear design of the PBZ has allowed for a 40% reduction in weight (approx. 22 kg) while achieving extremely high-speed operation (CV mode: 100 kHz) and low ripple noise.

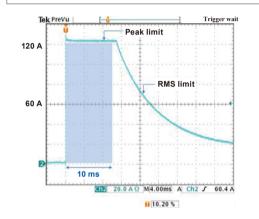

Inrush current output up to 6 times the rating! (CV mode)

"A" models

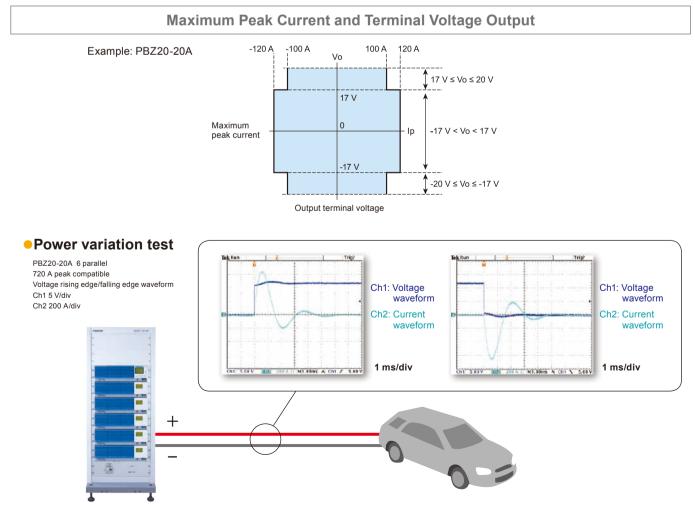

The PBZ20-20A is capable of generating a short-term peak current up to 6 times the rating when current response is set to 1ms in CV mode. Other response settings will activate the current limit and allow the operator to safely use the device without 6x peak current output. When current response is set to 1ms, the PBZ20-20A automatically decreases response speed and allows for peak current ouput while the current limit is deactivated. This means that the current function will be active at all times when short-term peak current is not output and will have no effect on current response in CC mode. Short-term peak current output is available in both bipolar and unipolar mode.

Recommended Peak Current Duration and Range (Protection)

We recommend a maximum peak current output of up to 6 times the rating (5 times depending on output voltage) within a duration of 10ms (blue area on left). A minimum interval of at least 1 second is required between peak currents, as shorter intervals can cause hardware malfunction. The figure on the left shows the peak and rms current limits when the output is shorted.

- In the peak limit area, peak current is capped at 105% of 6x the rating and can be retained for at least 10 ms.
- There are cases where normal waveforms cannot be generated within the peak limit area. Current limits will still be active ensuring the safety of the operator.
- In the rms limit area, the peak current is limited by the rms value. The current will decrease down to the rated current according to the duration settings.
- When sinking power in quadrant 2 and 4, power will be limited after 10 ms and the regular current limit will be activated.

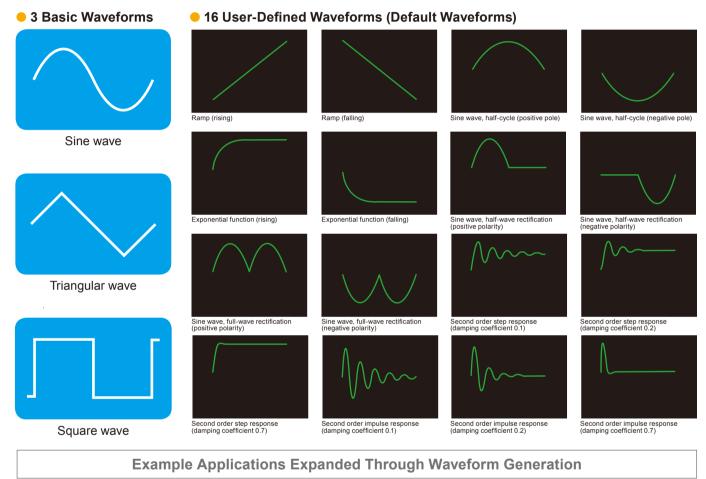

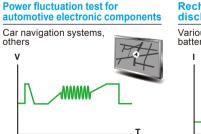

Built-in function generator for customizable waveform generation!

In addition to basic sine, square and triangular waveforms, the PBZ allows the operator to customize up to 16 user-defined waveforms with the internal function generator. Amplitude, frequency, start phase, frequency sweep and square wave duty can be programmed as needed. 16 user-defined waveforms can be freely edited and registered to the PBZ internal memory. The sequence feature (see P6) allows for each step in an individual waveform to be customized in detail for a maximum of 1024 steps among 16 programs. *Waveform editing requires proprietery software (Wavy for PBZ). (See P14.)

3 Synchronized Operation

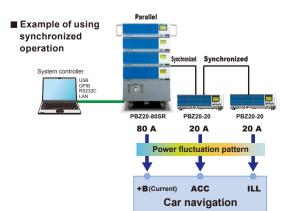

Seamless sequence execution with no deviation between synchronized units!

This feature allows the user to synchronize the output of multiple PBZ units when executing a sequence, preventing any deviations from occuring even during a long sequence. *Excluding start up delay of up to 1 µs

Synchronized Multichannel Voltage Variation Tests for Automotive Standards!

[Multichannel voltage variation test example]

Power for automotive vehicles is supplied by the battery, but the power is activated by multiple internal electronic components (+B \rightarrow ACC \rightarrow IG) turning ON/OFF in a specific order. There are an extremely large number of electronic components that can cause instability within the automobile, including engine start-up and electrical circuit chattering. Therefore, problems caused by this instability such as power interruptions and fluctuations can be planned for and avoided by performing rigorous voltage variation tests on all channels for automotive electronic components.

CH3 : ILL LINE

Backup power supply line (ILL) that directly pulls up +B, IG, and ACC.

This feature allows the user to increase the output current by connecting multiple units in parallel. This setup can easily be completed with 2 identical models and the optional parallel operation kit. For systems that require more than 3 units, please refer to the PBZ-SR Series (P16). For systems that require more than 6 units, please contact your local Kikusui distributor. (Standard models)

Parallel operation kit (option)

The optional accessory kit for connecting 2 PBZ units in parallel (same model). Please select the following kit that best fits your testing requirements. *Bracket is not included for PK02-PBZ and PK03-PBZ

For Desktop use: PK01-PBZ

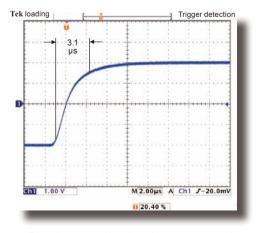

Contents: Bracket, Insulating sheet, OUTPUT terminal connection bar, Parallel output terminal cover, Bracket screws (M4-8L), Spacer, Load wire screw (M5-10L), Parallel operation signal cable

- For Rack-mounted system: PK02-PBZ (For EIA inch size) Contents: Insulating sheet, OUTPUT terminal connection bar, Load wire screw (M5-10L), Parallel operation signal cable
- For Rack-mounted system: PK03-PBZ (For JIS metric size) Contents: Insulating sheet, OUTPUT terminal connection bar, Load wire screw (M5-10L), Parallel operation signal cable

100 kHz/150 kHz frequency specifications (CV).

The excellent waveform quality combined with the ultra-fast rise/ fall time of $3.5 \ \mu s$ allow the PBZ to reproduce a wide variety of waveforms of the highest quality.

▲ Rise time example when 3.5 µs response is set

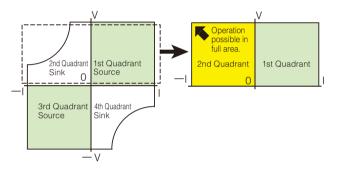

*1. 100 kHz for standard models (PBZ20-20, 40-10, 60-6.7, 80-5) *2. 150 kHz for "A" models (PBZ20-20A)

2. 150 kHz for "A" models (PBZ20-20A)

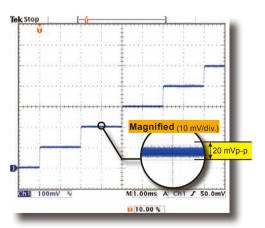

The unipolar function is unique to the PBZ. "Unipolar mode" allows the PBZ to apply current in both directions (source and sink) while current flows in a single direction. As seen in the diagram below, this feature allows the user full operation in the 1st and 2nd quadrants. Unipolar mode allows the user to bypass power restrictions (PBZ20-20: 100 W, PBZ40-10: 180 W) present in the 2nd and 4th quadrants when in bipolar mode.

Bipolar mode (Four quadrants) Unipolar mode (Two quadrants)

The excellent waveform quality of the PBZ minimizes noise effects on simulations and pulse-driven devices.

▲ Sample of actual 0.1 V step waveform Ripple 2 mVrms, noise 20 mVp-p(PBZ20-20)

*PBZ40-10 :Ripple 4 mVrms, noise 20 mVp-p PBZ60-6.7 :Ripple 4 mVrms, noise 30 mVp-p PBZ80-5 :Ripple 4 mVrms, noise 30 mVp-p

40 % lighter than previous models

The switching + linear design of the PBZ has allowed for a 40% reduction in weight (approx. 22 kg) resulting in the improved accessibility and portability of bench-top test systems.

Expanded measurement

Built-in measurement features allow for easy testing without the need for multimeters and other measurement devices. Furthermore, the measurement time TRIG signal allows the operator to program measurement start time and measurement delay time.

Memory functions

Preset memory

Stores setting conditions most often used. Three memory slots are available for CV mode and CC mode. Settings stored are limited to DC signal and AC signal.

Setup memory

This can be used as general memory storing all basic settings. Up to 10 memories can be set, regardless of mode.

CC/CV selection feature

Select CV mode when using constant-voltage, and CC when using constant-current. The voltage and current uppower/lower limits utilize a "V" and "I" limit function.

Response switching

Response speeds can be switched in both CV and CC mode. The output voltage and current rise/fall time will be effected by the response settings. (Response time setting indicates rise/fall time.)

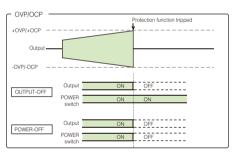

Setting description	CV mode Voltage		CC mode Current response					
	response	PBZ20-20	PBZ40-10	PBZ60-6.7	PBZ80-5			
	3.5 µs	35 µs	70 µs	35 µs	35 µs

values	35 µs	350 µs	350 µs	350 µs	350 µs			
	100 µs	1 ms	1 ms	1 ms	1 ms			
Factory default setting	3.5 µs	35 µs	70 µs	35 µs	35 µs			

Protections (overvoltage, overcurrent, V-I LIMIT, overheating)

Overvoltage and overcurrent protection

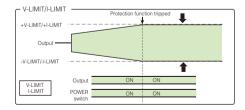

This protection activates when the output voltage/current exceeds the protective trip points. The protective trip points can be set seperately in both positive (+) and negative (-) polarities. The following three options can be selected when a protection is activated.

- ▶ OUTPUT-OFF : Output is turned OFF.
- ▶ PPOWER-OFF: Output and POWER switch are turned OFF.

► V/I-LIMIT

Prevents voltage and current exceeding the protection trip points. (Output is not turned OFF.) The V-I/LIMIT function allows the unit to automatically switch from CV mode to I-LIMIT and from CC mode to V-LIMIT. This also allows the unit to automatically switch from CV mode to CC mode, and from CC mode to CV mode.

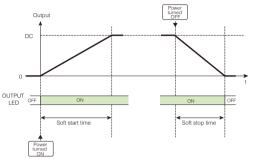

Overheating protection

This protection is activated when the PBZ temperature reaches abnormally high levels. This protection protects the product from test environments that exceed the ambient temperature, or when sufficient ventilation has not been provided for the intake and exhaust ports.

Soft start and soft stop function

The soft start feature allows the user to gradually increase the output to a given value when turned ON. With soft stop, the user can gradually decrease the output from a given value to 0 when turned OFF. Soft start and stop times can only be set for DC settings. If the OUTPUT key is pressed while soft start or soft stop is in progress, the operation will be cancelled and output turned OFF.

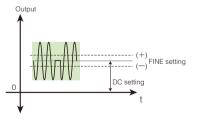

Fine settings function

Fine adjustments (increase, decrease) can be made to the DC setting value.

Input range

- PBZ20-20A/PBZ20-20
 CV: DC setting value ±1.0000 V, resolution 0.0001 V
- CC: DC setting value ±1.0000 A, resolution 0.0001 A ● PBZ40-10 CV: DC setting value ±2.0000 V, resolution 0.0001 V
- CC: DC setting value ±0.5000 Å, resolution 0.0001 Å PBZ60-6.7
- CV: DC setting value ±3.0000 V, resolution 0.0002 V CC: DC setting value ±0.3350 A, resolution 0.0001 A
- PBZ80-5

CV: DC setting value ± 4.0000 V, resolution 0.0002 V CC: DC setting value ± 0.2500 A, resolution 0.0001 A

Key lock

3 levels of key lock are available.

- Disable all key operations other than OUTPUT, RECALL, and A,B,C memory functions.
- Disable all key operations other than OUTPUT.
- Disable all key operations. (excluding KEY LOCK (SHIFT + LOCAL) KEY)

Remote sensing function

Remote sensing function stabilizes the load terminal output voltage by compensating for voltage drops caused by resistance in the load wires. This function can be used in CV mode with one-way compensation of up to approx. 0.5 V. Please make sure to select load wires with sufficient current capacity so that load wire voltage drop does not exceed the voltage compensation.

Output voltage/current monitor

- Voltage monitor Rear panel (J1 connector)
 0 to ±2 V from 0 V to ± rated voltage
- Current monitor Front panel (BNC terminal)
 0 to ±2 V from 0 A to ± rated current
 Frequency characteristics DC to 20 kHz (-3 dB)
 Rear panel (J1 connector)
 0 to ±2 V from 0 A to ± rated current

External control

● External output ON/OFF ● Shutdown

Status signal output

CV, CC, OUTPUT, and ALARM are output.

External signal input (external voltage control)

The PBZ series is compatible with two types of input signals.

 The DC signal from the internal signal source can be controlled via external voltage at the rear panel (J1 connector) from DC control signal 0 to approx. ±10 V.

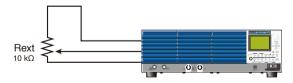

Front panel EXT SIG IN (BNC terminal) input signal.
 Composed of a bipolar amplifier using EXT SIG IN (BNC terminal) as the input signal.

The amplifier gain, polarity (inverted, non-inverted) and offset can be set with a maximum input voltage of ±12 Vpeak, maximum input impedance of 10 k Ω , and a common terminal connected to OUTPUT terminal COM.

External signal input (external resistance control)

DC signal of the internal signal source can be controlled using an external variable resistor to change the standard voltage and voltage ratio. With CV and CC mode, the operator can control both voltage and current, respectively. The output is the sum of the external resistor setting, DC panel setting, and remote controller setting.

Temperature-sensitive fan motor

Internal temperature is detected and maintained with an internal fan cooling system.

Interface

USB, GPIB and RS232C standard digital interface. For LAN (option), see P13.

*3. At an ambient temperature between 18 °C and 28 °C, with a 100 Hz sine wave, 35 μs response, and shorted output.

*4. A frequency where the amplitude ratio of the output current to the external signal input voltage is -3 dB (when the reference frequency is 100 Hz, the response is 35 μs, and a rated load is connected). The frequency response changes according to the load impedance. When the load impedance increases, the frequency response decreases.

voltage rating. *5. The rise or fall time (at rated load; excluding when output is turned on and off). The rise and fall times change according to the load impedance

*7. The measurement frequency bandwidth is 10 Hz to 1 MHz (when the output voltage is in the range of 10 % to 100 % of the rated output voltage).
*8. The change in the output current in response to a change in the output voltage from 10 % to 100 % of the

Fall time:The time it takes for the output current to fall from 90 % to 10 % of the rating when the output current is changed from the rated current to 0 A.

9. The change in the output current in response to a ±10% change in the input voltage in reference to the nominal input voltage (when the output voltage is in the range of 10 % to 100 % of the voltage rating).

Unless specified otherwise, the specifications are for the following settings and conditions.

• The warm-up time is 30 minutes (with current flowing).

• TYP: These values due that are representative of situations where the PBZ operates in an environment with an ambient temperature of 23 °C.
These values do not guarantee the performance of the PBZ.

• rtg: Indicates the rated voltage or current.
• setting: Indicates a setting.
• rdng: Indicates a setting.

- rtg: setting: rdng: rtg/CF:

rdng: Indicates the readout value of a measured result.
rtg/CF: The reated voltage or rated current divided by CF (crest factor).
The polarity of the output voltage and current is defined as follows.
Voltage: Using the output's COM terminal as a reference, the voltage is positive (+) when the OUT terminal is positive and negative (-) when the OUT terminal is negative.
Current: Positive (+) when ourrent flows out from the OUT terminal and negative (-) when current flows into the OUT terminal.
The output specifications apply to the rear panel output terminal and chassis terminal. Remote sensing is not being performed. The auxiliary output terminals may not meet the specifications.
Loads are defined as follows: When the PBZ is generating its rated voltage, the load causes the rated current to flow. Or, when the PBZ is generating its rated voltage drop to the PBZ's rated voltage.

*1. Does not apply to specially made or modified PBZs.

*2. This is a Class I equipment. Be sure to ground this product's protective conductor terminal. The safety of this product is only guaranteed when the product is properly grounded.

*3. Pollution is addition of foreign matter (solid, liquid or gaseous) that may produce a reduction of dielectric strength or surface resistivity. Pollution Degree 2 assumes that only non-conductive pollution will occur except for an occasional temporary conductivity caused by condensation.

*4. This is a Class A equipment. This product is intended for use in an industrial environment. This product may cause interference if used in residential areas. Such use must be avoided unless the user takes special measures to reduce electromagnetic emissions to prevent interference to the reception of radio and television broadcasts.

*5. This is a Group I equipment. This product does not generate and/or use intentionally radio-frequency energy, in the form of electromagnetic radiation, inductive and/or capacitive coupling, for the treatment of material or inspection/analysis purpose.

Parallel operation kit

(For EIA inch size)

Application software

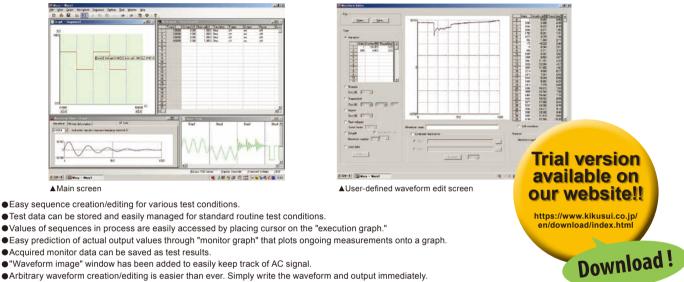

Control Kikusui power supplies and electronic loads with precision!

Expanding the limits of electronic engineering "Wavy" sequence creation software

 Sequence creation software "Wavy for PBZ" [Operating environment] Windows Vista / Windows 7 / Windows 8 / Windows 10 *For details, please see our company's homepage.

"Wavy" is an application software that allows for easy sequence creation and control for Kikusui power supplies and electronic loads. No programming knowledge is required as sequences can be easily drawn or created on a spreadsheet!

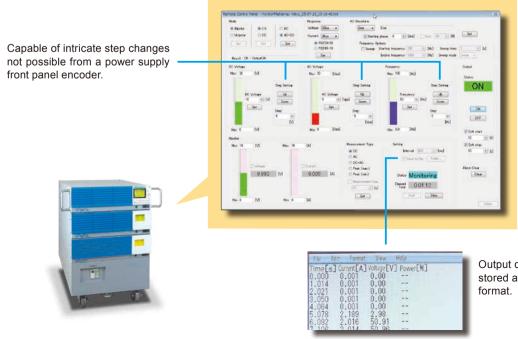

- Easily "select" and "deselect" sequence steps within the waveform. Activate and deactivate "pause", "trigger function", or "AC waveform"
- according to your testing requirements.

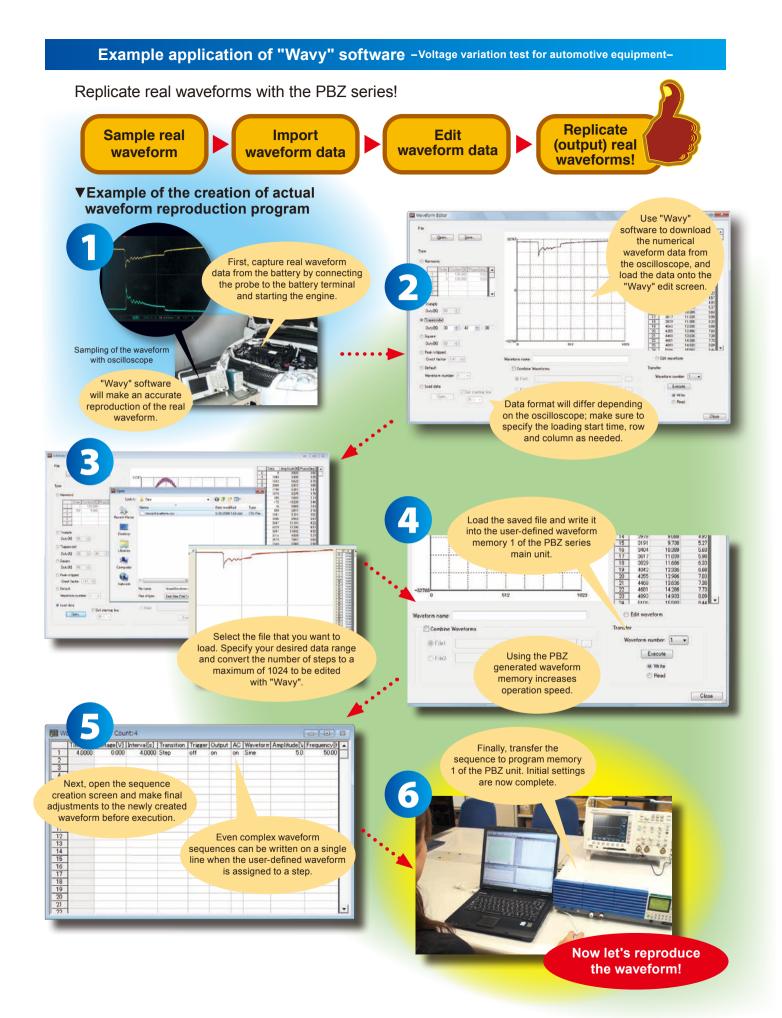

Example application of "Wavy" software -Step conversion and monitoring-

Easily control your test instruments with a virtual controller

"Wavy" software direct control is perfect for intricate operations too complicated to be performed via the power supply front panel. "Wavy" software can be used as a convenient "remote control" for power supplies and electronic loads, as well as a simple data logger.

Output can be monitored and data stored as a text file in CSV or TSV format.

Revolutionizing high power bipolar power supply system design! High power with fast response speeds

▲PBZ-BP Series

High Power Intelligent Bipolar Power Supply **PBZ BP Series**

4-quadrant operation allows for both the sourcing and sinking of power, ideal for driving both inductive and capacitive loads. Also, the PBZ SR/BP is equipped with LAN, USB, GPIB and RS232C standard digital interfaces.

- User-defined waveform generation function
- Sequence function
- Synchronized operation function
- Central control with the master unit utilizing master and slave operation
- Displays the total output current of all units on the master unit (display of combined value) *1
- Safety design that switches all units off whenever the alarm is occurred on any unit of the system ⁺²
- Guarantee of specifications with Smart Rack (test data standardly included)
- Equipped with LAN (Supports of LXI), USB, GPIB, and RS232C, as standard interface.

*1 Slave unit displays its own output current *2 Clearing alarm for master unit clears alarms on all units.

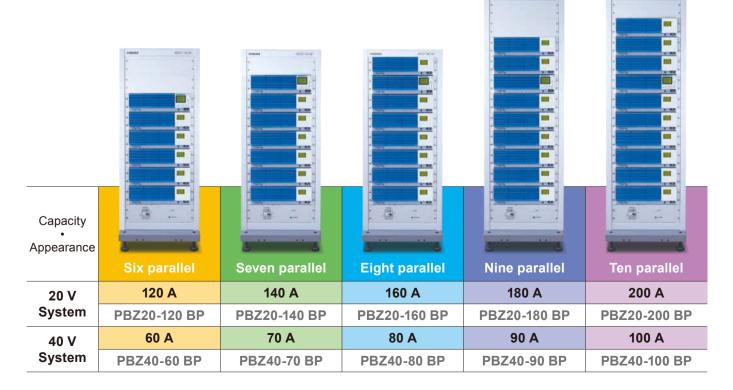

PBZ SR Series line-up

Available in a total of 12 models up to 2 kW maximum output with 4 output voltage types: ± 20 V, ± 40 V, ± 60 V, and ± 80 V.

Capacity Appearance	Three parallel	Four parallel	Five parallel
20 V	60 A	80 A	100 A

age's settable range.

*2: At an ambient temperature of 23 °C ±5 °C.

*3: 1 kHz sine wave, 3.5 µs response.

- *4: A frequency where the amplitude ratio of the output voltage to the external signal input voltage is -3 dB $\,$ (when the referencefrequency is 1 kHz, the response is 3.5 $\mu s,$ and when a rated load is connected).
- *5. The rise or fall time (at rated load; excluding when output is turned on and off). The frequency response is based on the specified response setting (frequency bandwidth = 0.35/the rise time).

Rise time: The time it takes for the output voltage to rise from 10 % to 90 % of the rating when the output voltage is changed from 0 V to the rated voltage.

Fall time: The time it takes for the output current to fall from 90 % to 10 % of the rating when the output current is changed from the rated current to 0 A.

*7: The measurement frequency bandwidth is 10 Hz to 20 MHz (at the output terminals).

- *8: The measurement frequency bandwidth is 10 Hz to 1 MHz (at the output terminals). *9: The change in the output voltage in response to a change in the output current from 0 % to 100 % of the current rating (measured at the sensing terminals when remote sensing is used).
- *10: The change in the output voltage in response to a ± 10 % change in the input voltage in reference to the nominal input voltage(measured at the sensing terminals when remote sensing is used).

*11: You can set the DC current in 0.001 A (0.0001 A for the fine feature) steps, but it may not change at this resolution depending on the relationship with the internal D/A resolution.

*12: You can set the AC current in 0.01 A steps, but it may not change at this resolution depending on the relationship with the internal D/A resolution.

Condition in which the output COM terminal is connected to the chassis with the short piece (included) at the rear output terminal. If not specified,condition in which remote sensing is performed at output terminal. Warm-up time is 30 minutes (condition with current flowing). Load is pure resistance. TYP value is typical value for 23°C, but performance is not guaranteed.

*13: 100 Hz sine wave, 35 $\mu s/70~\mu s$ response, and shorted output.

*14: A frequency where the amplitude ratio of the output current to the external signal input voltage is -3 dB (when the reference frequency is 100 Hz, the response is 35 $\mu s/75~\mu s,$ and a rated load is connected). The frequency response changes according to the load impedance. When the load impedance increases, the frequency response decreases

*15: The rise or fall time (at rated load; excluding when output is turned on and off). The rise and fall times change according to the load impedance. Rise time: The time it takes for the output current to rise from 10 % to 90 % of the rating

when the output current is changed from 0 A to the rated current.

Fall time: The time it takes for the output current to fall from 90 % to 10 % of the rating when the output current is changed from the rated current to 0 A.

*16: Under short circuit or rated load.

*17: The measurement frequency bandwidth is 10 Hz to 1 MHz (when the output voltage is in the range of 10 % to 100 % of the rated output voltage).

*18: The change in the output current in response to a change in the output voltage from 10 % to 100 % of the voltage rating.

*19: The change in the output current in response to a ± 10 % change in the input voltage in reference to the nominal input voltage(when the output voltage is in the range of 10 % to 100 % of the voltage rating).

*1: At an ambient temperature of 23 °C \pm 5 °C.

*2: When the input signal is in the 100 kHz bandwidth and has a crest factor of 3 or less (the measurement time is at least 10 times the input signal period).

*3: Calibrated with a 1 kHz sine wave.

*4: At 70 %rh humidity or less

*1: The peak value of the sum of the DC voltage and AC voltage is limited by the DC voltage's settable range.

*2: At an ambient temperature of 23 °C±5 °C.

*3: 100 Hz sine wave, response 10 μs. Under no load.

*4: A frequency where the amplitude ratio of the output voltage to the external signal input voltage is -3 dB (when the reference frequency is 1 kHz sine wave, the response is 3.5 μs, when the OUTPUT1 terminals are used, and when a rated load is connected).

*5: The rise or fall time (at rated load; excluding when output is turned on and off). The frequency response is based on the specified response setting (frequency bandwidth = 0.35/the rise time).

Rise time: The time it takes for the output voltage to rise from 10 % to 90 % of the rating when the output voltage is changed from 0 V to the rated voltage.

Fall time: The time it takes for the output voltage to fall from 90 % to 10 % of the rating when the output voltage is changed from the rated voltage to 0 V.

*6: Under no load or rated load.

*7: The change in the output voltage in response to a fluctuation in the output current from 0 % to 100 % of the output current rating (measured at the sensing terminals when remote sensing is used).

*8: The change in the output voltage in response to a ±10 % fluctuation in the input voltage in reference to the nominal input voltage (measured at the sensing terminals when remote sensing is used).

*9: The display resolution and the actual resolution are different. The display resolution of DC current is 0.001 A, but the actual resolution is 0.006 A. (When the fine feature is in use, the display resolution is 0.000 1 A, but the actual resolution the solution 6 A). The display resolution of AC current and the actual resolution are 0.1 A. The display resolution of overcurrent protection is 0.1 A, but the actual resolution is 0.6 A. [Conditions]

Condition in which the output COM terminal is connected to the chassis with the short piece (included) at the rear output terminal.

If not specified, condition in which remote sensing is performed at output terminal.

Warm-up time is 30 minutes (condition with current flowing). Load is pure resistance. TYP value is typical value for 23°C, but performance is not guaranteed.

*10: With a 100 Hz sine wave, 35 μs response, and shorted output.

*11: A frequency where the ratio of the output current amplitude to the external signal input voltage amplitude is -3 dB (when the reference frequency is 100 Hz, the response is 35 µs, and when a rated load is connected). The frequency response change according to the load impedance. Frequency response decreases when the load impedance increases.

*12: The rise or fall time (at rated load; excluding when output is turned on and off). The rise and fall times change according to the load impedance.

Rise time: The time it takes for the output current to rise from 10 % to 90 % of the rating when the output current is changed from 0 A to the rated current.

Fall time: The time it takes for the output current to fall from 90 % to 10 % of the rating when the output current is changed from the rated current to 0 A.

*13: Under short circuit or rated load.

*14: The change in the output current in response to a change in the output voltage from 10 % to 100 % of the rated output voltage.

*15: The change in the output current in response to a ±10 % fluctuation in the input voltage in reference to the nominal input voltage (when the output voltage is in the range of 10 % to 100 % of the rating).

*1: At an ambient temperature of 23 °C ±5 °C.
*2: When the input signal is in the 100 kHz bandwidth and has a crest factor of 3 or less (the measurement time is at least 10 times the input signal period).
*3: Calibrated with a 1 kHz sine wave.
*4: At 70 %rh humidity or less
*5: At 200 V, 60 Hz for PBZ20-200BP

[Conditions] Condition in which the output COM terminal is connected to the chassis with the short piece (included) at the rear output terminal. If not specified,condition in which remote sensing is performed at output terminal. Warm-up time is 30 minutes (condition with current flowing). Load is pure resistance. TYP value is typical value for 23°C, but performance is not guaranteed.

PBZ20-20	±20 V/ ±20 A	PBZ40-50 SR	±40 V/ ±50 A	PBZ20-160 BP	±20 V/ ±160 A
PBZ40-10	±40 V/ ±10 A	PBZ60-20.1 SR	±60 V/ ±20.1 A	PBZ20-180 BP	±20 V/ ±180 A
PBZ60-6.7	±60 V/ ±6.7 A	PBZ60-26.8 SR	±60 V/ ±26.8 A	PBZ20-200 BP	±20 V/ ±200 A
PBZ80-5	±80 V/ ±5 A	PBZ60-33.5 SR	±60 V/ ±33.5 A	PBZ40-60 BP	±40 V/ ±60 A
PBZ20-60 SR	±20 V/ ±60 A	PBZ80-15 SR	±80 V/ ±15 A	PBZ40-70 BP	±40 V/ ±70 A
PBZ20-80 SR	±20 V/ ±80 A	PBZ80-20 SR	±80 V/ ±20 A	PBZ40-80 BP	±40 V/ ±80 A
PBZ20-100 SR	±20 V/ ±100 A	PBZ80-25 SR	±80 V/ ±25 A	PBZ40-90 BP	±40 V/ ±90 A
PBZ40-30 SR	±40 V/ ±30 A	PBZ20-120 BP	±20 V/ ±120 A	PBZ40-100 BP	±40 V/ ±100 A

■ Cable Options

Model	Description	Remark
AC8-3P3M-M5C	AC input power cable	8sq Heavy PVC jacketed three-core cable 3 m (Only for SR series)
AC14-3P3M-M5C	AC input power cable	14sq Heavy PVC jacketed three-core cable 3 m (Only for BP series)
TL01-PLZ	Low inductance cable	Maximum allowable current: 100 A, Full length: 50 cm
TL02-PLZ *1	Low inductance cable *2	Maximum allowable current: 100 A, Full length: 1 m (For PBZ20 V, 40 V, and SR series)
TL03-PLZ *1	Low inductance cable *2	Maximum allowable current: 100 A, Full length: 2 m (For PBZ20 V, 40 V, and SR series)
LIC40-2P1M-M6M6	Low inductance cable *2	Maximum allowable current: 50 A, Full length: 1 m (For PBZ60 V, 80 V, and SR series)
LIC40-2P2M-M6M6	Low inductance cable *2	Maximum allowable current: 50 A, Full length: 2 m (For PBZ60 V, 80 V, and SR series)

*1: 2pcs of TL02-PLZ or TL03-PLZ shall be in parallel to be used for PBZ20V BP. *2: LOW inductance cable can be used only when output is grounded, and cannot be used when not grounded. (For SR Series)

Other Options

Model	Description	Remark
PK01-PBZ	Parallel operation kit	For bench-top
PK02-PBZ	Parallel operation kit	For EIA inch racks
PK03-PBZ	Parallel operation kit	For JIS millimeter racks
OP01-PBZ-A	M8 terminal connection kit	
KRB3-TOS	Rack mount brackets	For EIA inch racks
KRB150-TOS	Rack mount brackets	For JIS millimeter racks; blank panel included
Wavy for PBZ	Sequence creation software	Operating environment: Windows Vista / Windows 7 / Windows 8 / Windows 10
LAN	LAN interface	IEEE488.2/SCPI
VS01	Vertical stand	580(22.83)W × 245(9.64)H × 350(13.78)Dmm(inch); stand only (maximum dimensions)
