## MX370x Series Software

The MG3710A/MG3710E Vector Signal Generator supports up to two RF output connectors each with two waveform memories. One RF output connector can output two combined modulation signals, while two connectors can output four modulation signals. As a result, one MG3710A/MG3710E can output wanted + interference signals, wanted + delay signals, and multicarrier signals, which normally requires two vector signal generators, helping cut setup and operation times.

The MG3710A/MG3710E has a wide vector modulation bandwidth, large arbitrary waveform memory, and outputs digital modulation signals for major mobile communications technologies. Today's mobile communications are focused mainly on mobile telephones and wireless LAN and the MG3710A/MG3710E offers the ideal signal-generation functions and performance needed for the latest wideband wireless communications. The built-in arbitrary waveform generator outputs modulation signals simply by selecting the waveform pattern matching the required communication method.

The following four categories of waveform patterns are supported:

- Standard waveform patterns
- Waveform patterns generated by optional MX3700xxA/MX3710xxA Waveform Pattern software
- Waveform patterns generated by optional MX3701xxA IQproducer software
- Waveform patterns converted from data generated by common signal-generation software

Each category contains multiple waveform pattern files each with preset parameters for each system.

These default waveform patterns are saved on the MG3710A/MG3710E hard disk for easy access, but other waveform patterns are supported using the IQproducer waveform generation software.

Parameters for the waveform for the target communication system are set using a GUI to generate a waveform pattern file for the MG3710A/MG3710E. The embedded Windows application IQproducer saves generated arbitrary waveform pattern files to the internal hard disk and signals are output simply by selecting the waveform pattern. In addition, a user-generated custom IQ sample file in ASCII format created by common Electronic Design Automation (EDA) software such as MATLAB, can be converted into a custom waveform pattern file for the MG3710A/MG3710E.

## Standard

### LTE Waveform Patterns

The LTE FDD and LTE TDD waveform patterns listed in the table below are stored on the MG3710A/MG3710E internal hard disk. Modulation signals for evaluating the Tx characteristics of a base station amplifier are output simply by selecting a pre-saved standard waveform pattern. If another signal is required, use the LTE IQproducer MX370108A (for FDD) or LTE TDD IQproducer MX370110A to create and save the custom waveform pattern.

The CDMA2000 1xEV-DO waveform patterns listed opposite are stored on the MG3710A/MG3710E internal hard disk.

The 3GPP2 signals specified for testing receivers and transmitters of CDMA2000 1xEV-DO access networks (base station) and access terminal (AT) are output by selecting one of the 13 forward and 10 reverse data rate patterns.

When multi-carrier signals, mixed idle and active signals and/or multi-user signals are required, the optional CDMA2000 1xEV-DO IQproducer MX370103A application, software can be used to set parameters and generate waveform patterns.

### Access Terminal (AT) Receiver Test

3GPP2 C.S0033 standard receiver tests (PER: Packet Error Rate) can be performed by selecting a forward signal pattern for testing the AT.

Since protocols are not supported for the access network simulator and all transmission channels are traffic, while all other channels (Sync, etc.) are unsupported, an external controller (PC) must be used to control the AT and calculate the PER.

## CDMA2000 Waveform Patterns

The CDMA2000 waveform patterns listed in the table below are stored on the MG3710A/MG3710E internal hard disk.

The 3GPP2 C.S0002-0-2-specified CDMA2000 modulation signals are output by selecting one of these CDMA2000 waveform patterns.

Reverse channel signals are output by channel coding (convolutional coding, etc.) 4-frame length PN9 fix\*<sup>1</sup> data, which is useful for measuring the Frame Error Rate (FER)\*<sup>2</sup> of base stations and evaluating devices.

- \*1: Since the data length is not an integer multiple of the PN sequence length (511 bits for PN9), the PN sequence becomes discontinuous at the end.
- \*2: This is the case when the timing signal and 1.2288 Mcps × 11 clock signal (or 5 or 10 MHz reference clock) can be input from the test target base station to the MG3710A/MG3710E in order to synchronize the frame start point and chip clock.

# PDC Packet Waveform Patterns

Standard

## PDC Packet Waveform Patterns

The four waveform patterns listed in the table below are stored on the MG3710A/MG3710E internal hard disk.

The RCR STD-27-specified signals for testing base station and mobile station receivers for UPCH communications can be output by selecting one of these waveform patterns without setting any complex RCR STD-27 parameters.

In addition, the Downlink3 data rate UPCH pattern and Uplink1 UPCH pattern can be switched.

When a signal with different parameters is required, the optional TDMA IQproducer MX370102A can be used to set parameters and generate waveforms.

Waveform Patterns	Uplink/Downlink	Output Slot	File Size [MB]
DL_Packet_Slot_0	Downlink	Slot 0=UPCH Slot 1=IDLE (all "1") Slot 2=IDLE (all "1")	6.6
DL_Packet_Slot_01	Downlink	Slot 0=UPCH Slot 1=UPCH Slot 2=IDLE (all "1")	6.6
DL_Packet_Slot_all	Downlink	Slot 0=UPCH Slot 1=UPCH Slot 2=UPCH	6.6
UL_Packet_Slot_0	Uplink	Slot 0=UPCH Slot 1=Transmit off Slot 2=Transmit off	2.1

\* Since the recorded file size is rounded up to the nearest 0.1 MB, the true file size may be smaller.

Consider this when selecting the ARB memory upgrade option

## Frame Configuration

There are four types of TDMA frame configurations for PDC Packet waveform patterns: downlink 1-slot transmission, downlink 2-slot transmission, downlink 3-slot transmission, and uplink 1-slot transmission. Each TDMA frame is composed of three slots, and data is generated cyclically based on one TDMA frame.

A PN9 pseudo random pattern in the CAC field of each slot has continuity. In downlink UPCH 2-slot transmission, for example, the end of the CAC field in Slot 0 and the start of the CAC field in Slot 1 are continuing. Also, the end of the CAC field in Slot 1 and the start of the CAC field in Slot 0 of the next frame are continuing in this case.

# WLAN Waveform Patterns

## WLAN Waveform Patterns

The WLAN (IEEE802.11a/b/g) waveform patterns listed in the table below are stored on the MG3710A/MG3710E internal hard disk. Signals for testing the receiver and transmitter of a terminal or module can be output by selecting one of these patterns. The waveform patterns shown below are the signals for one packet. When a waveform pattern is selected, the signal is output in an endless loop. To stop the signal at a fixed number of packets, use the IQproducer Combination File Edit function to generate the sequence file first and select it using the MG3710A/MG3710E.

\*1: Use SYNC\_ADJ in combination with DATA0, DATA1, DATA10, and DATA1c. When selecting a file, press the Baseband key on the MG3710A/MG3710E to set Pattern Combination to Defined. Refer to the MG3710A/MG3710E Vector Signal Generator Operation Manual (main frame) for details about how to make the settings.

\*2: The repeatability of the subframe output timing of the RF output versus external start trigger input is reduced to 10 ns max.

\*3: When executing a Doppler test, change the RF frequency and sampling clock at the same rate.

The sampling clock when the Doppler frequency is 0 Hz is 4.092 MHz. For example, when applying a +4 kHz Doppler frequency, the following expression establishes (providing the sampling clock as "CLK"):  $(1575.42 \text{ MHz} + 4 \text{ kHz}) / 1575.42 \text{ MHz} = \text{CLK} / 4.092 \text{ MHz}$  then:  $\text{CLK} = 4.09201039 \text{ MHz}$ .

Refer to the MG3710A/MG3710E Operation Manual (Mainframe) for RF frequency and sampling clock settings.

\*4: To use this waveform pattern, Combination of Baseband Signal (option), ARB Memory Upgrade 256 Msample (option), or ARB Memory Upgrade 1024 Msample (option), is required.

\* Since the recorded file size is rounded up to the nearest 0.1 MB, the true file size may be smaller.

Consider this when selecting the ARB memory upgrade option
