AV-1010, AV-1011, AV-1015 SERIES<br>30 / 50 / 100 VOLT, 0.5 / 2 / 10 ns RISE TIME GENERAL-PURPOSE PULSE GENERATORS AND LASER DIODE DRIVERS

$100 \mathrm{kHz}, 500 \mathrm{~ns},>+100 \mathrm{~V}$ into $50 \Omega$
The $A V-1015-B$ is Avtech's general-purpose $\pm 50 \mathrm{~V}$ pulse generator, and the AV-1010-B is the generalpurpose $\pm 100 \mathrm{~V}$ model. These models will operate into loads of $50 \Omega$ or higher, and they offer 10 ns rise and fall times (20\%-80\%).

The more-specialized AV-1011B1-B and AV-1011B3-B models offer faster rise and fall times (100V / 2 ns for the AV-1011B1-B, and 30V / 0.5 ns for the AV-1011B3$B)$. These faster models require a $50 \Omega$ load.

Model AV-1010-B is a fully-featured general-purpose instrument that can be controlled from the userfriendly front-panel keypad and LCD, or by the IEEE488.2 GPIB and RS-232 computer-control ports. The amplitude of the $A V-1010-B$ can be varied up to $\pm 100 \mathrm{~V}$, and the pulse width is adjustable from 20 ns to 10 ms . The output impedance (i.e., the internal resistance in series with the output) can be switched between $2 \Omega$ and $50 \Omega$ (regardless of the output impedance setting, the load impedance must be $50 \Omega$ or higher). The rise and fall times are fixed at less than 10 ns (20\%-80\%).

The AV-1010-B can be triggered four ways: by the internal oscillator (variable from 1 Hz to 1 MHz ), by an external TTL pulse applied to a rear-panel BNC connector, by a front-panel pushbutton, or by computer command. In the external trigger mode, the pulse width may be set by the front-panel controls (or the computer interface), or it may be set to track the input trigger pulse width. The maximum duty cycle ( $100 \% \times$ Pulse Width / Period) is $10 \%$.

The AV-1015-B has a lower maximum amplitude ( $\pm 50$ Volts), but operates to repetition rates as high as 10 MHz , and duty cycles as high as $25 \%$. The rise and fall times are 10 ns , and the pulse width is variable from 20 ns to 10 ms .

In many applications, the AV-1010-B will serve well as a replacement or alternative for discontinued highvoltage pulse generators from HP, Agilent, Datapulse, and others, including the HP 214A, 214B, HP/Agilent 8114A, and Systron-Donner Datapulse 114A. Avtech

- 0 to $\pm 30 \mathrm{~V}, \pm 50 \mathrm{~V}$, or $\pm 100$ Volts into 50 Ohms
- 0.5, 2 and 10 ns rise time models
- Up to 10 MHz for 50 V , and 1 MHz for 100 V
- 2 Amps to a laser diode load (or 4 or 8 Amps with accessory transformers)
- General-purpose workhorses
- Variable baseline option available
- IEEE-488.2 GPIB and RS-232 computer control ports
- Optional ethernet port for VXI-11.3 support
also offers higher-voltage models suitable as replacements for Velonex models.
The 100 V model AV -1011B1-B offers much faster rise and fall times ( 2 ns , instead of 10 ns ), with a reduced maximum pulse repetition frequency of 100 kHz and a maximum duty cycle of 5\%. The AV-1011B3-B offers even faster rise and fall times ( $<500 \mathrm{ps}$ ), at lower amplitudes (up to 30 V , into $50 \Omega$ ). These model require a 50 Ohm load; they will not operate correctly into high-impedance loads.
To allow easy integration into automated test systems, the programming command set is based on the SCPI standard, and LabView drivers are available for download. All models include memory to store up to four complete instrument setups. The operator may use the front-panel or the computer interface to store a complete "snapshot" of all key instrument settings, and recall this setup at a later time.

All models include IEEE-488.2 GPIB and RS-232 computer-control ports. The -VXI option adds a rearpanel Ethernet connector, allowing an instrument to be remotely controlled using the VXI-11.3, ssh, telnet, and web protocols. In particular, the VXI-11.3 features allows software like LabView to control an instrument using standard VISA communications drivers and network cabling, instead of using older-style GPIB cabling and GPIB controller cards.

The output stages will safely withstand any combination of front-panel control settings, output open or short circuits, and high-duty cycles. An internal power supply monitor removes the power to the output stage for five seconds if an average power overload exists. After that time, the unit operates normally for one second, and if the overload condition persists, the power is cut again. This cycle repeats
until the overload is removed. With a $50 \Omega$ load the AV-1010-B will operate at duty cycles as high as $10 \%$, but with high impedance loads the duty cycle may be as high as $50 \%$. The output will source up to 2.5 A (1.2A for the AV-1015-B) and will automatically shut down if the load current exceeds this value.
All models include a delay feature. The output can be advanced or delayed up to 1 second relative to the SYNC output (the delay must be less than $75 \%$ of the period, however). In the Double Pulse mode, the delay setting control the separation between the double pulses, with a minimum pulse separation of 100 ns .

A gate input is provided. This input can be set active high or active low, and it can be set to act synchronously or asynchronously.
The AV-1010-B is offered with an offset option, allowing the pulses to be shifted up to $\pm 20 \mathrm{~V}$. When generating a pulse with positive amplitude, the offset plus amplitude must remain between 0 and +100 V , and when generating a pulse with negative amplitude, the offset plus amplitude must remain between 0 and -100V.
The AV-1010-B may also be used as 2 , 4 or 8 Ampere laser diode drivers (1, 2, or 4 Amps for the AV-1015B) using the methods illustrated on the following page. To supply 2 Amps to a diode load from the AV-1010-B, simply add a 50 Ohm resistor in series with
the diode to limit the current and terminate the transmission line. For 4 Amp and 8 Amp applications, Avtech pulse transformers can be used, although the transformers will limit the maximum pulse width. (In general, better waveforms are obtained by using higher voltage pulsers with 50 Ohm resistances, rather than using transformers.)
For high voltage operation into high impedance loads, see the AVR-G and AVR-GHV familes. For higher voltage operation into 50 Ohm loads, see the AVR-3-B, AVR-4-B, AVR-5B-B, AVR-7B-B, and AVR-8A-B families. For higher duty cycles and average powers, consider the AVR-2 series.

Model AV-1010-B replaces the older discontinued AV-1011-B model. It is essentially identical to the earlier model, but the AV-1010-B provides an improved pulse width range.

AV-1015-B, FRONT PANEL

AV-1015-B, REAR PANEL

| Model': | AV-1015-B | AV-1010-B | AV-1011B1-B | AV-1011B3-B |
| :---: | :---: | :---: | :---: | :---: |
| $\begin{array}{r} \text { Amplitude }^{2,7} \text {, with } Z_{\text {OUT }}=2 \Omega: \\ \text { with } Z_{\text {Out }}=50 \Omega: \end{array}$ | $\begin{aligned} & \leq 5 \text { to } 50 \mathrm{~V} \\ & \leq 1 \text { to } 25 \mathrm{~V} \end{aligned}$ | $\begin{aligned} & \leq 10 \text { to } 100 \text { Volts } \\ & \leq 1 \text { to } 50 \text { Volts } \end{aligned}$ | $\leq 10$ to 100 Volts $\leq 2$ to 50 Volts | $\leq 3$ to 30 Volts $\leq 1$ to 15 Volts |
| Pulse width (FWHM) ${ }^{3}$ : | 20 ns to 10 ms | 20 ns to 10 ms | 100 ns to 1 ms | 100 ns to 10 ms |
| Rise \& fall time (20\%-80\%): | $\leq 10 \mathrm{~ns}$ | $\leq 10 \mathrm{~ns}$ | $\leq 2 \mathrm{~ns}$ | $\leq 0.5$ ns |
| Pulse repetition rate: | 1 Hz to 10 MHz | 1 Hz to $1 \mathrm{MHz}^{5}$ | 1 Hz to 100 kHz |  |
| Maximum duty cycle: | $25 \%$ into $50 \Omega$ loads <br> $50 \%$ into $>200 \Omega$ | $10 \%$ into $50 \Omega$ loads, $50 \%$ into $>1 \mathrm{k} \Omega$ loads | 5\% |  |
| Output impedance (Z Out $^{\text {( }}$ : | $\approx 2 \Omega$ or $50 \Omega$, switchable |  |  |  |
| Required load impedance: | $\geq 50 \Omega$ |  | $50 \Omega$ |  |
| Output polarity: | Positive or negative, switchable |  |  |  |
| DC offset: | 0 V , fixed | OV, fixed (Optional ${ }^{4,5 \mathrm{~F}}$ : 0 to $\pm 20 \mathrm{~V}, 0.4 \mathrm{~A}$ max) | 0 V , fixed |  |
| Leading edge overshoot (into a non-inductive $50 \Omega$ load): | $\leq 8 \%$ of maximum rated amplitude for all amplitudes. Typically < $3 \%$ at maximum amplitude. Settles to $\pm 3 \%$ of stable amplitude within 60 ns . |  |  |  |
| Typical pulse-top droop: | $\mathrm{dV} / \mathrm{dt} \approx \mathrm{l}_{\text {out }} \div 4000 \mathrm{uF}$ | dV/dt $\approx$ Iour $\div 4000 \mathrm{uF}$ | ح 5\% worst-case |  |
| Double pulse mode spacing: | 100 ns to 1 second (measured between the two leading edges of the pulse doublet) ${ }^{8}$ |  |  |  |
| Sync output: | +3 V , $>30 \mathrm{~ns}$, to $\geq 50 \Omega$ | > +3 Volts, > 50 ns , will drive 50 Ohm loads |  |  |
| Gated operation: | TTL, synchronous or asynchronous, active high or low, switchable. |  |  |  |
| Trigger modes: | Internal trigger, external trigger (TTL-level pulse, > $10 \mathrm{~ns}, 1 \mathrm{k} \Omega$ input impedance), front-panel "Single Pulse" pushbutton, or single pulse trigger via computer command. In the external trigger mode, the pulse width may be set by the instrument, or it may be set to track the input pulse width. |  |  |  |
| Variable delay: | Sync to main output: 0 to $\pm 1.0$ seconds, for all trigger modes (including external trigger). |  |  |  |
| Propagation delay: | $\leq 150 \mathrm{~ns}$ (Ext trig in to pulse out) |  |  |  |
| Jitter: | $\leq \pm 35 \mathrm{ps} \pm 0.015 \%$ of sync delay (sync out to pulse out) |  |  |  |
| GPIB and RS-232 control ${ }^{1}$ : | Yes, standard feature on all -B units. |  |  |  |
| Ethernet port, for remote control using VXI-11.3, ssh, telnet, \& web: | Optional ${ }^{5}$. Recommended as a modern alternative to GPIB / RS-232. |  |  |  |
| LabView drivers: | Available for download |  |  |  |
| Settings resolution: | The resolution of the timing parameters (pulse width, delay, period) varies, but is always better than $0.15 \%$ of (\|set value| +20 ns ). The amplitude resolution is $<0.1 \%$ of the maximum amplitude. |  |  |  |
| Settings accuracy: | Typically $\pm 3 \%$ (plus $\pm 1 \mathrm{~V}$ or $\pm 2 \mathrm{~ns}$ ) after 10 minute warmup, at low duty cycles ${ }^{9}$. For high-accuracy applications requiring traceable calibration, verify the output parameters with a calibrated oscilloscope. |  |  |  |
| Output protection: | The output is protected against short circuits, open circuits, and high duty cycle |  |  |  |
| Connectors, Main output: Other: | BNC female BNC female |  |  | SMA female BNC female |
| Power requirements: | 100-240 Volts, 50-60 Hz |  |  |  |
| Dimensions: | $100 \mathrm{~mm} \times 430 \mathrm{~mm} \times 375 \mathrm{~mm}$ (3.9" $\times 17{ }^{\prime \prime} \times 14.8$ ") |  |  |  |
| Chassis material, weight: | Anodized aluminum with blue-gray plastic trim. $\leq 10 \mathrm{~kg} / 22 \mathrm{lbs}$. Designed \& assembled in North America. |  |  |  |
| Temperature range: | $+5^{\circ} \mathrm{C}$ to $+40^{\circ} \mathrm{C}$ |  |  |  |
| Optional rack-mount kit: | Add the suffix "-R5" to the model number to include 19" rack mount kit |  |  |  |

[^0]6) This is the internal resistance in series with the output. It is not the load resistance
7) The output can be set at lower values, but the overshoot may become significant relative to the pulse amplitude at low amplitudes.
8) The time between the trailing edge of the first pulse and the leading edge of the second pulse (the "dead time" when the output voltage is zero) must be equal to or greater than the set pulse width plus 100 ns . For instance, if the pulse width is 1 us , the programmed delay between leading edges must be greater than 1 us (the pulse width) +1.1 us (the minimum dead time) $=2.1$ us.
9) The amplitude may decrease $\sim 10 \%$ relative to the programmed setting if the instrument is operating at or near the maximum specified duty cycle.

## Laser Diode Driver Applications

The AV-1010-B can be used as a 2 , 4 or 8 Ampere laser diode driver using these configurations:

Use a 50 Ohm resistor to match the laser diode to the AV-1010-B. This limits the current to a safe level for the AV-1010-B, and terminates the coaxial cable to minimize ringing.

The AVX-MRB5 transformer can be used to double the output current to a maximum of 4 Amps . The load impedance must be reduced by a factor of 4 , to 12 Ohms. The maximum pulse width is limited to 10 us.

The AVX-MRB6 transformer can be used to quadruple the output current to a maximum of 8 Amps. The load impedance must be reduced by a factor of 16 , to 3 Ohms. The maximum pulse width is limited to 10 us.

Similarly, the AV-1015-B can be used as 1, 2 or 4 Ampere laser diode driver using these techniques.

Typical Waveforms

Output of an AV-1010-B into 50 Ohms. $20 \mathrm{~V} / \mathrm{div}, 100 \mathrm{~ns} / \mathrm{div}$. 20 $/$ div, 100 ns/div.

AVX-MRB5 output waveform into $12.5 \Omega$
( $50 \mathrm{~V} / 12.5 \Omega=4 \mathrm{~A}$ ), when driven by a +100 V pulse from an AV-1010-B. $20 \mathrm{~V} / \mathrm{div}$, 2 us/div.

Avtech has been in business since 1975, and in that time many large companies have discontinued all or part of their pulse generator offerings. Fortunately, Avtech can provide alternatives for many discontinued models from HP, Agilent, Velonex, Systron-Donner, and other manufacturers!

The table below compares the models in this series to the Agilent 8114A.

Avtech AV-1010-B / AV-1015-B, compared to the AGILENT 8114 A

| Model: | AV-1010-B | AV-1015-B | Agilent 8114 A |
| :---: | :---: | :---: | :---: |
| Pulse output amplitude: ( $\mathrm{R}_{\mathrm{L}}=50$ Ohms) | $\begin{aligned} & \leq 10 \text { to } 100 \text { Volts }\left(\text { for } Z_{\text {out }}=2 \Omega\right) \\ & \leq 1 \text { to } 50 \text { Volts (for } Z_{\text {out }}=50 \Omega \text { ) } \end{aligned}$ | $\begin{aligned} & \leq 5 \text { to } 50 \text { Volts (for } Z_{\text {out }}=2 \Omega \text { ) } \\ & \leq 1 \text { to } 25 \text { Volts (for } Z_{\text {out }}=50 \Omega \text { ) } \end{aligned}$ | $\leq 2$ to 100 Volts (for "HI Z" mode) $\leq 1$ to 50 Volts (for "50 Ohm" mode) |
| Max load current: | 2 Amps (8 Amps possible with AVX-MRB6 Pulse Transformer) | 1 Amp (4 Amps possible with AVX-MRB6 Pulse Transformer) | 2 Amps |
| Pulse width (FWHM): | 20 ns to 10 ms | 20 ns to 10 ms | 10 ns to 150 ms |
| Rise \& fall time: | $\leq 10 \mathrm{~ns}, 20 \%-80 \%$ |  | $\leq 12 \mathrm{~ns}, 10 \%-90 \%$ (for "HI Z" mode) $\leq 7 \mathrm{~ns}, 10 \%-90 \%$ (for "50 Ohm"mode) |
| Pulse repetition rate: | 1 Hz to 1 MHz | 1 Hz to 10 MHz | 1 Hz to 15 MHz |
| Maximum duty cycle: | $10 \%$ into $50 \Omega$ loads, $50 \%$ into $>1 \mathrm{k} \Omega$ loads | 25\% into $50 \Omega$ loads, $50 \%$ into $>200 \Omega$ loads | $16 \%$ for maximum output into a 50 Ohm load in " 50 Ohm" mode. |
| Output impedance: | $\approx 2 \Omega$ or $50 \Omega$, switchable |  | High Impedance or $50 \Omega$, switchable |
| Required load impedance: | $\geq 50 \Omega$ |  | $50 \Omega$ is required |
| Output stage configuration: | Voltage source which is highly tolerant to load mismatches, providing for user-friendly operation. |  | Current source. A $50 \Omega$ load is mandatory, either internally or externally. Will not operate into a high impedance due to the current-source configuration of the output. |
| Maximum average output power: | 20 Watts | 12.5 Watts | 30 Watts |
| Output protection: | The output is protected against short and open circuits, and high duty cycles |  | Protected against power dissipation. |
| Output polarity: | Positive or negative, switchable |  | Positive or negative, switchable |
| DC offset: | 0 V , fixed (0 to $\pm 20 \mathrm{~V}$ option) | 0 V , fixed | Option, 25 Volts |
| Jitter: | $\leq \pm 35 \mathrm{ps} \pm 0.015 \%$ of sync delay |  | Not specified |
| Pulse aberrations: | Leading edge overshoot $\leq 8 \%$ of maximum amplitude. Settles to $\pm 3 \%$ of stable amplitude within 60 ns . |  | < 5\% of amplitude |
| Double pulse mode spacing (leading edges): | 100 ns to 1 second |  | 20 ns to 999 ms |
| Sync to main out delay: | 0 to $\pm 1$ second |  | 0 to 999 ms |
| Sync output: | $+3 \mathrm{~V}, 100 \mathrm{~ns} \mathrm{( } \mathrm{R}_{\mathrm{L}}>50 \Omega$ ) |  | $+2.5 \mathrm{~V}, \sim 50 \%$ duty cycle ( $\mathrm{R}_{\mathrm{L}}>50 \Omega$ ) |
| Gated operation: | TTL, synchronous or asynchronous, active high or low, switchable. |  | TTL, inhibit on edge or level |
| External trigger: | TTL (Low $=0 \mathrm{~V}$, High $=+3 \mathrm{~V}$ to +5 Volt ) pulse, 50 ns or wider. |  | Adjustable level, +/-50V |
| External trigger propagation delay: | $<150 \mathrm{~ns}$ |  | ? |
| Burst mode | Option, 1-500 pulses |  | Standard, 1-65536 pulses |
| GPIB \& RS-232 control: | Yes |  | Yes |
| Ethernet control: | Optional. |  | No |
| Connectors: | BNC female |  | BNC female |
| Power requirements: | 100-240 Volts, $50-60 \mathrm{~Hz}$ |  | 100-240 Volts, $50-60 \mathrm{~Hz}$ |
| Dimensions: | $100 \mathrm{~mm} \times 430 \mathrm{~mm} \times 375 \mathrm{~mm}$ (3.9" $\times 17$ " $\times 14.8$ ") |  | $5.2 " \times 16.3 " \times 16.6^{\prime \prime}$ |
| Chassis: | Aluminum, $\leq 10 \mathrm{~kg}$ ( 22 lbs ). |  | ?, 14 kg |
| Temperature range: | $+5^{\circ} \mathrm{C}$ to $+40^{\circ} \mathrm{C}$ | $+5^{\circ} \mathrm{C}$ to $+40^{\circ} \mathrm{C}$ | $0^{\circ} \mathrm{C}$ to $+50^{\circ} \mathrm{C}$ |
| Optional rack-mount kit: | Yes, -R5 option | Yes, -R5 option | Yes, option 1 CM |

[^0]:    1) -B suffix indicates IEEE-488.2 GPIB and RS-232 control of amplitude and frequency.
    2) The output amplitude may also be controlled by applying 0 to +10 V DC to a rear-panel BNC connector
    3) The output pulse width may also be controlled externally by applying a TTL-level trigger of the desired width to a rear-panel BNC connector (PWIN = PWOUT mode).
    4) For adjustable ( 0 to $\pm 20 \mathrm{~V}$ ) DC offset, add -OT to the model number (e.g., AV-1010-B-OT). When generating a pulse with positive amplitude, the offset plus amplitude must remain between 0 and +100 V , and when generating a pulse with negative amplitude, the offset plus amplitude must remain between 0 and -100 V .
    5) Add the suffix -VXI to the model number to specify the Ethernet port.
